In the past year, nearly **175,000 Canadians** were diagnosed with cancer. Through advocacy, research, and the daily struggle to improve quality of life, more are surviving this diagnosis than **ever before.**

A cause that affects all Canadians

In the past year, nearly 175,000 Canadians were diagnosed with cancer. But unlike decades ago, today more than 60 percent of them will survive, compared to just 25 percent in the 1940s. We've made great strides in research and prevention and our understanding of new treatment options, but we can do more.

In this supplement, you'll read several stories about individuals and organizations that are part of the cancer fight. It's a fight we all share because life and lives should be about living—not cancer.

Current research shows that about half of cancers can be prevented through healthy lifestyle choices and policies that protect the public. You can make a difference by learning how to reduce your risk, including tobacco use, nutrition and fitness, alcohol consumption, and sun and UV exposure.

Catching it is half the battle

The Canadian Cancer Society is also helping Canadians to better prevent cancers through significant prevention research projects:

- The Cancer Prevention Initiative, which is funding projects studying behavioural, biological or environmental risk factors;
- Endowed prevention research chairs in Nova Scotia and British

Columbia;

■ Joint funding of the Occupational Cancer Research Centre in Ontario to identify, prevent and ultimately eliminate workplace exposures to cancer-causing substances.

One size doesn't fit all

But prevention remains only part of the story.

We're also making significant gains in the area of cancer genetics, leading to "smarter" treatments that help to pinpoint who will benefit from a treatment and who will not. It is leading to the development of targeted treatments, which ensure that the right treatments are given at the right time to the right patients.

The newest, most promising treatments, however, are often costly and can lead to financial hardships for many. That is why the Society is lobbying the federal government to establish a national catastrophic drug insurance program. The Society believes that Canadians, no matter where they live, should have equal access to drug treatments.

There's no doubt that the cancer experience is a difficult one. Months of treatment can take a physical, financial and psychological toll on patients and their families, and the Society is determined to make a difference

Peter Goodhand
President and CEO,
Canadian Cancer Society

MY BEST TIPS

Whatever it takes

1 We do everything we can to prevent cancer, save lives and support people living with cancer.

What you can do

2 We offer the most meaningful opportunities for you to make the biggest difference.

Learn more

3 Visit fightback.ca to find out how you can help.

in this journey. Our influence can be measured in the research we have funded, which has had a real impact on the health and lives of Canadians, our advocacy on cancer-related issues, and the critical work we do each day to ensure Canadians focus on the fight for life and against cancers.

What you can do

Across the country in April, individuals will join the Society to mark Daffodil Month, spending hours selling daffodils, knocking on doors and organizing events to raise essential funds which help us prevent cancer, research better ways to treat cancer and help individuals and their families who are affected by cancer.

April is also a time to unite behind those individuals living with cancer. On April 27, we're asking Canadians to show their support to those on a cancer journey by wearing a daffodil pin.

With the ongoing support of donors, volunteers, staff and partners, the Canadian Cancer Society will make the most impact, with Canadians, against cancers, for life.

The Canadian Cancer Society is your best partner in the fight against cancer:

Visit fightback.ca to find out how you can help.

A Canadian-led initiative in prostate cancer prevention

Prostate cancer is the most common cancer to afflict Canadian men, affecting one in six.

Fortunately, more than 90 percent of prostate cancers are curable if detected and treated in their early stages. Prostate Cancer Canada (PCC) strongly recommends the merits of prostate specific antigen (PSA) blood testing starting at age 40 and advises men to have the discussion with their doctors.

Prostate Cancer Canada is a national organization dedicated to the fight against prostate cancer. PCC funds the development of programs related to awareness, public education, advocacy, support of those affected, and research into the prevention, detection, treatment and cure of prostate cancer.

A Canadian-led initiative

Recently launched is a Canadian research project with The Interna-

Steve Jones,
President and CEO,
Prostate Cancer Canada

"Fortunately, more than 90 percent of prostate cancers are curable if detected and treated in their early stages."

tional Cancer Genome Consortium (ICGC) called The Canadian Prostate Cancer Genome Network (CPC GENE), which will map the genetic structure of prostate cancer. "Prostate Cancer

Canada is excited to be leading this important international study which will lead to collaboration and knowledge sharing. From a patient perspective, and the one in six Canadian men who will be diagnosed with prostate cancer in their lifetime, this should result in improved diagnostics and better treatment strategies" says Steve Jones, president and CEO of Prostate Cancer Canada.

Support where it counts

In addition to working with research and medical communities, PCC is committed to working with men and their families affected by prostate cancer. Estimates suggest there are up to 250,000 prostate cancer survivors across Canada, yet support groups may only be reaching 10,000 of them. Through the Prostate Cancer Canada Network (PCCN), the Foundation is focused on establishing a nation-wide network of prostate cancer support groups. To date, 60 support groups have affiliated with PCC. PCCN aims

to reach every community to raise awareness of prostate cancer and to support patients and their families who are affected by the disease.

Prostate Cancer Canada holds many events throughout the year that allow Canadians to show their support for the cause. Movember is PCC's single biggest fundraising campaign whereby men grow and groom a moustache for the month of November to raise awareness and funds for prostate cancer. In addition to Movember, PCC also has a number of other fundraising events, the most widely recognized of which are the Safeway Fathers Day Walk/ Run (FDWR) in June, and the Wake Up Call Breakfast in April. These events, in addition to others, are a great way to encourage community involvement and have a significant impact in raising funds and awareness for prostate cancer.

Canadians Focus on Availability of Cancer Therapies: Survey

Growing concern about quality of life issues and treatment options

If you were diagnosed with terminal cancer and told you had weeks to live, how much would extending that time be worth?

Dr. Scot Dowden, a medical oncologist at the Tom Baker Cancer Centre in Calgary, says his patients answer that question with remarkable stories of perseverance.

He describes a 33-year-old man with colon cancer that spread to his liver. Thanks to one medication, he was able to buy a little more time – enough to move up his planned wedding, and gain a step-daughter in the process). Just four days after getting married, he passed away in his parents’ home.

Another patient, a 78-year-old woman, couldn’t even sit upright due to excruciating pain from her cancer. Dr. Dowden gave her a dose of a drug that had taken four years to get funded by the province, because it adds only four to eight weeks of life. Yet during those weeks, the woman responded enough to dance at her granddaughter’s wedding: “They had to haul her off the floor,” says Dr. Dowden.

Currently, he’s treating a 51-year-old woman who has already been through all the lines of chemotherapy. She’s open to at any therapy that would add a few more months, so she can see her daughter graduate from high school this spring.

Dr. Dowden relays the stories in the wake of a national survey released by the Colorectal Cancer Association of Canada (CCAC) called “*Weighing Quality of Life in Cancer*” (made pos-

sible through an educational grant from AMGEN Canada).

The survey found that given a diagnosis of terminal cancer, 44 percent of people would seek different treatment options in the hopes of survival, and 35 percent would look for options to prolong life.

The results don’t surprise Dr. Dowden. Patients will go to great lengths to meet the next milestones and goals in their lives, he says.

“From a scientific and funding point of view, a drug that extends life just a few months is not a clinically significant outcome. But for people affected by a malignancy, that time can make a huge difference in their ability to have meaningful interactions with loved ones—and that is clinically significant.”

Lack of confidence in access

The survey found that 82 percent of respondents believe it’s difficult to get the most current quality of life treatments from their province. Seven out of 10 would be prepared to travel out of province or out of country to access treatments.

The numbers reflect a sense, says Dr. Dowden, that health care governing bodies often aren’t funding “cutting edge therapies”. Access can depend on your jurisdiction and type of cancer. He says that funding for cancer drugs tends to be more forthcoming for certain tumour sites (like breast and prostate) than for others (like lung and colorectal).

In addition to gauging views on drug availability and coverage, the “*Weigh-*

ing Quality of Life in Cancer” survey found that 82 percent of Canadians have been touched by cancer, i.e. they’ve had a close friend or family member battle cancer, or have done so themselves.

“If you did the same study just 10 years ago, the number would have been maybe 50 to 60 percent,” says Dr. Dowden. “People are living longer, and surviving other diseases, so as time goes on more and more people will be affected by cancer, eventually 100 percent.”

According to the Canadian Cancer Society, 40 percent of women

and 45 percent of men will develop cancer during their lifetimes, and an estimated one-in-four Canadians will die from cancer.

Call to action

Considering these rates and the attitude of Canadians, Barry Stein, president of the CCAC, calls the survey a “call to action” for health care authorities. They need to do more, he says, to meet the needs of patients and caregivers who are increasingly impacted by cancers, including access to treatments that can improve quality of life for patients with late-stage cancer.

“The survey demonstrates that Canadians want additional treatment options, even after a terminal cancer diagnosis. When asked what they would spend their time doing if they only had a few more weeks to live, in addition to spending more time with family and friends, 35 per cent of respondents said they would spend that time seeking options that may prolong life and prevent the cancer from progressing.” — Barry Stein

AMGEN

Advertorial

Retirement made possible by new myeloma treatment

“I’m going to get to retire after all!” says Kevin Connell very happily from his home in Fredericton, New Brunswick.

While many older Canadians may look forward to saying that, Mr. Connell does so with special feeling as his date of official retirement from a career as a Crown prosecutor in New Brunswick approaches at the end of April. For him, it wasn’t a matter of finances or being able to tear himself away from his work. For the past six years, his concern has been surviving the blood cancer multiple myeloma.

He’s still fighting, but he is a face for the promising future of treating this and other types of cancer – the face of someone who’s been given his life back, thanks to new research and new treatments.

Mr. Connell spent a good part of 2005 trying to find out why he was feeling unwell. The diagnosis finally came in September – multiple myeloma, a cancer of the blood plasma cells that develop in the bone marrow. Historically, the prognosis was not good but recent treatment advances continue to improve, making this incurable disease now very treatable and

allowing patients to live longer with a significantly improved quality of life.

In Mr. Connell’s case, the best first option was a stem cell transplant, a procedure which allows the patient to survive high-dose chemotherapy by the re-infusion of their own previously collected stem cells. The procedure does not cure myeloma but offers the hope of prolonged remission. Mr. Connell had the transplant in January 2006 at the nearest location where it was possible – in Halifax under the care of Dr. Darrell White. It went well, and by October he was back at work.

The inevitable return of the illness started in the spring of 2008, leading to a six-month routine during which he and his wife, Mariette, commuted weekly to Dr. White in Halifax from Fredericton, a five-hour drive, to spend four days a week receiving a drug treatment, Velcade, intravenously. Difficult as that was, it bought more time.

Last winter, however, the toll on his immune system was growing and he was hospitalized twice for pneumonia while pain developed in his arms and shoulders from the difficulties in his bone marrow. There were two options, said Dr. White – radiation to treat the bone pain, or a new treatment provided by Celgene, Revlimid.

This time, the drug came to the Connells in Fredericton instead of them having to go to

Kevin and Mariette Connell

Photograph: Denise Rowe

it. He gets blood tests done regularly and still visits Dr. White every three months, but otherwise his treatment is all done at home.

The result? “It has completely changed our lives for the better,” he says. “I now have total functional use of my arms and legs. My physical appearance has changed to the point where people assume I have achieved the impossible and beaten multiple myeloma. For the first time in five years, gaining weight has become a problem.”

And, adds Mrs. Connell remembering all those trips to Halifax, “It doesn’t interrupt our lives at all.”

The highlight? On August 7, 2010, Mr. Connell walked his daughter down the aisle and was able to enjoy the three days of wedding celebrations without many difficulties. “I know I wouldn’t have been able to do it without the new treatment,” he says. “I felt close to like the good old days.”

Dr. White is also encouraged by the benefits he is seeing in many of his patients. “This is a disease that needed new treatment options and having patients respond well and regain quality of life is very rewarding,” he said.

Mr. Connell considers himself fortunate in many ways. “We’ve

beaten the odds so far,” he says.

For Mrs. Connell, every new treatment option is a step in the right direction. “We have to keep hoping they will find more new treatments and eventually get to a cure,” she says. “We have no choice but to be optimistic.”

INSPIRATION

Question: How can a diagnosis of colorectal cancer transform your life’s work?

Answer: By turning you into a force for patient education, support and advocacy.

Refusing to be powerless by prognosis

CHANGE

Barry Stein will never forget the weakest point of his life— because it was also the most “empowering”, says the Montreal lawyer.

Stein, now 56, was meeting his oncologist after colon surgery in 1996. Weeks earlier, Stein had been diagnosed with colon cancer. He was confident about the surgery, but the results were now in, and the cancer had spread to his liver. The oncologist was blunt.

“He said I had a 30 percent chance of surviving five years, if they got it out of the liver—at which point, I fainted,” says Stein.

When he came to, he realized that those words made him weak, not the disease. Stein resolved to fight against cancer with all his energy, and a consistently positive attitude. “I never accepted the idea that I wouldn’t be here,” he says.

Association raises awareness and action

Stein faced many challenges along the way. He underwent four liver surgeries. A pump was implanted in his abdomen to deliver chemotherapy. A year after his last surgery, the cancer metastasized to his lungs. Three more surgeries ensued, along with additional chemo and the removal of a rib. However, he emerged from the ordeal cancer-free, and has remained so for the

last eight years.

Stein’s battle against the disease continues in his role as president of the non-profit Colorectal Cancer Association of Canada (www.colorectal-cancer.ca), which he co-founded in 1998. At the time, he says, people weren’t talking much about colorectal cancer.

The reality is that it’s the second-leading cause of cancer death in Canada. About 22,500 Canadians will be diagnosed with colorectal cancer this year (affecting men and women equally), and 9,100 will die of it. In their lifetimes, one-in-14 men and one-in-six women are expected to develop the disease.

The Colorectal Cancer Association of Canada has three main roles—awareness and education (prevention, screening and healthy lifestyles); support for patients; and advocacy (for screening programs, and equal and timely access to drugs and surgical techniques).

Survivor stories inspire

Screening is critical, says Stein. Colorectal cancer is preventable and highly treatable when caught early.

Colonoscopy screening is recommended for men and women beginning at age 50, unless other risk factors exist (e.g. family history, obesity, smoking, ulcerative colitis, or Crohn’s disease). Besides a colonoscopy, screening options include a fecal occult blood test (FOBT), fecal immunochemical test (FIT), sigmoidoscopy, and the

PROFILE

■ **Age when first diagnosed:** 41

double-contrast barium enema.

More than half of the people diagnosed have no symptoms (e.g. a change in stools, rectal bleeding, abdominal pain, unexplained weight loss, or constant fatigue). The appearance of symptoms may signify a more advanced disease. (Stein’s own cancer was detected after a colonoscopy; he thought he merely had a case of hemorrhoids.)

Though still a practicing lawyer, Stein spends “200 percent of my time” working to advance the goals of the Colorectal Cancer Association of Canada. What inspires him, he says, are the stories he hears every day of people who’ve been diagnosed with cancer, and their “intense desire to

survive.”

He feels fortunate not only to be a cancer survivor, but to have the chance to advocate for progress in the fight.

“Being able to change things for the betterment of others is what you’ll be remembered for,” says Stein. “I could have been the best lawyer in town, but that would hardly have made any difference at all. But encouraging people with cancer, changing policies and programs—that will have a long-lasting impact.”

TORONTO BOARD OF TRADE

WE BELONG 2011

The Children's Wish Foundation of Canada recently granted Alex Mann's wish to go to Hawaii with his family. Pictured (left to right) are: Haleigh, Adele, Alex, Courtney, Richard and Nicholas.
Photo: Children's Wish Foundation of Canada

Granting wishes for the past 27 years

■ They're the "wish kids": Canadian children, ages three to 17, facing life-threatening illnesses.

Over the past 27 years, the Children's Wish Foundation of Canada has granted close to 17,000 special wishes for these valiant kids, says Communications Director Paul St. Germain.

Pacey McIsaac, diagnosed with Acute Lymphoblastic Leukemia, explored Disney World with his parents and brother Brandon.

Craig Williams, diagnosed with brain cancer, realized his wish to meet NHL stars Brad Richards and Todd Bertuzzi.

Darcy Lee wanted to be close to his grandparents. "My wish was for my Grammy and Grampa to move from way out west in Edmonton to where we are on the East Coast so they could be near me," says Lee.

"We provide wish kids with once-in-a-lifetime unique experiences. It gives them something positive to focus on, giving them the drive to get

through the really tough periods," says St. Germain.

Cancer impacts the entire family. Parents are stressed; siblings often feel neglected. Craig's mom, Susan Williams, says, "When you have a child who is fighting cancer, your whole life changes. The Children's Wish Foundation is amazing. It really gave us a chance to become a family again, outside of the sickness."

"We're very proud to say that the Children's Wish Foundation has never refused an eligible child in 27 years. We have no waiting lists," says St. Germain.

"The demand for wishes has never been higher. Over the past four months, a record number of referrals have come into the foundation. We're focusing on fund-raising and strategic development to ensure that tradition will continue."

JEANNIE ARMSTRONG
editorial@mediaplanet.com

Get active and involved for colorectal cancer prevention

■ Colon cancer is the second leading cause of both male and female cancer-related deaths in Canada. In 2010 over 22,000 Canadians were diagnosed with colon cancer.

Although this is a startling statistic, more startling is the fact that almost half of those diagnosed died. Surprisingly, colon cancer is one of the most preventable forms of cancer. If caught early, over 90 percent of these cases could and should result in a full recovery.

"One of the issues surrounding colon cancer and the reason so many people don't get the help they need is the fear of talking about it," says Amy Elmaleh, co-founder of Colon Cancer Canada. "There seems to be a stigma attached to the disease that we need to dispel, and quickly. We are hoping that between our celebrity-driven PSA campaign and our events, we will get the word out that knowing the signs of colon cancer and talking about it with your family and your doctor will result in prevention and an effective cure. People need to "talk about it."

Colon Cancer Canada was started in 1996 with a mission to help fight this deadly disease. To date, with the help of hundreds of committed volunteers across the country, Colon Cancer Canada has raised more than \$6.6 million. Colon Cancer Canada is making a significant impact on this disease by financially assisting research efforts to find a cure and by offering a network of support for patients and families.

There are a number of activities tak-
